

Protect your data wherever it lives and goes

Overview

Cyberhaven's mission is to protect data wherever it lives and goes. Our **Unified AI & Data Security Platform** is the first truly integrated solution made for the AI era, enabling organizations to securely enable AI and the protect data that powers it. Cyberhaven combines data loss prevention, insider risk management, data security posture management, and AI security in a platform that's both easy to use and more effective than the sum of its parts.

New Challenges for the AI Era

A decade ago, cloud computing, SaaS, and collaboration tools democratized data, putting data into the hands of more and more workers. **This broke the file perimeter, creating fragments and derivatives of data that evade controls.**

Today, AI tools democratize intelligence, creating exponentially more fragments, derivatives, and pathways for data to flow. **This AI adoption magnifies human risk:** individual workers can create, consume, and move data like entire teams, departments, or companies, and AI agents can move data faster and at greater scale, introducing new human-like risks. **The result: 1,000x more "workers" putting data at risk.**

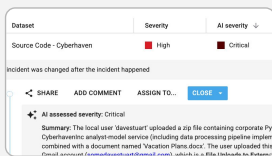

Cyberhaven: One Unified Solution for AI & Data Security

To meet this new era's challenges, we rebuilt data security from the ground up with a unified platform that is more effective than any mix of standalone tools: **accurate & contextual, holistic, frictionless, and actionable** protection for data wherever it lives and goes.

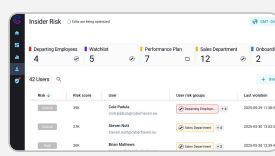

Agentic AI

Linea AI Detection Agent and Linea AI Analyst Agent

Data Loss Prevention

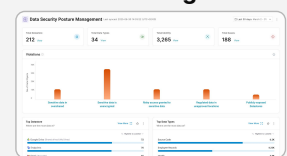

Insider Threat

AI Security

Data Security Posture Management

AI-Infused Frictionless User Experience

Context & Content

AI Categorization, Data Lineage, Identity, Access, Pattern Matching

Endpoint Agent

Browser Extension

Connectors

Our Unique Advantages: The Magic Behind Cyberhaven

Data Lineage	A technology we pioneered, data lineage traces the complete flow of data through organizations, providing vital context about where the data came from, who's interacted with it, and how it's been modified over time.
AI Categorization	Apply advanced AI to lineage, context, and content to achieve a deep understanding far beyond what's possible with rule-based approaches, or AI content inspection alone, delivering dramatically higher accuracy and more effective enforcement.
Agentic AI	Linea AI agents precisely analyze billions of workflows and every piece of data to find and report on insider risks. They understand how people work the way a human would, but never lose focus and can apply human-like insight to every single workflow in the enterprise.

Your Comprehensive Data Security Program

Discover and assess	Minimize exposure	Enable AI adoption	Reduce insider risk	Stop data loss and provide feedback
Discover and assess sensitive data and infrastructure across endpoints and cloud by continuously classifying data at rest, mapping where it lives, and identifying the sanctioned and unsanctioned tools that store or process it.	Minimize exposure by shrinking the sensitive data surface area through least-privilege access, removing non essential data, and eliminating risky or unsanctioned data infrastructure.	Enable AI adoption by governing AI tool usage, preventing sensitive data from being shared with shadow AI coaching users, and stopping compromised or malicious AI agents.	Reduce insider risk by identifying risky user behavior early through analysis of work and access patterns that flags suspicious intent and enables targeted intervention.	Stop data loss and provide feedback by blocking sensitive data exfiltration across endpoint and cloud, coach users in the moment to build strong security habits, and improve policies for better protection.

What You Get With Cyberhaven

Integrated Platform	High Accuracy	Easy to Operationalize
Cyberhaven uniquely provides an integrated platform that traces the full lifecycle and fragments of data across cloud, servers, and endpoints using data lineage.	Leveraging AI analysis of content, context, and data lineage provides unparalleled accuracy by deeply understanding the business context and workflows.	Data lineage simplifies policy creation and reduces false positives, making the security tool easy to operationalize by providing a tight feedback loop and enabling precise controls.

About Cyberhaven

Cyberhaven is reimagining data security. Until now, data security products have been limited to scanning data content or looking for specific user actions. Our AI-enabled data lineage technology analyzes billions of workflows to understand every piece of data within an organization, identify when it's at risk, and take action to protect it. To learn more, visit cyberhaven.com.
